from polyA+ mRNA using SuperScript Plasmid System Kit
(Invitrogen). The double-strand cDNAs were fractionated
in a sepharose CL-2B 40cm-columns and fragments sizing
between 0.8 and 1.5 Kb were directionally cloned into the
vector. Details of each source of RNA and library
construction can be obtained at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mol_type="mRNA"

/note="vector: Lambda ZAP II, excised phagemid; Site_1:
ECORI; Plants were grown under six following different
environmental regimes in greenhouse, Environment 1)
240C/170C day/night, well-watered, with post-anthesis
fertilizer, Environment 2) 240C/170C day/night,
well-watered, without post-anthesis fertilizer,
Environment 3) 370C/170C day/night, well-watered, with
post-anthesis fertilizer, Environment 4) 370C/170C
day/night plus drought, without post-anthesis fertilizer,
environment 5) 370C/170C day/night plus drought, with
post-anthesis fertilizer, Environment 6) 370C/170C
day/night plus drought, without post-anthesis fertilizer,
developing wheat grains from the following were excised
and frozen in liquid nitrogen, Environment 1 at 3, 5, 7,
8, 10, 12, 16, 20, 24, 28, 32, 36, 40, 44 DPA Environment
2 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 32, 36, 40, 44
DPA Environment 4 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28,
32, 34 DPA Environment 5 at 3, 5, 7, 8, 10, 12,
16, 20, 24, 28, 30 DPA Environment 6 at 3, 5, 7, 8, 10, 12,
16, 20, 24, 28, 30 DPA and total RNA was prepared by
S. Altenbach and K. Cronin at USDA-ARS, Albany, CA. A
cDNA library was made using poly (A) RNA, and the cDNA
clones were in vivo excised to give pBluescript SK(-)
phagemids in the TJ Close lab (Chin, Close, Fenton) at
the University of California, Riverside. Plasmid DNA
preparations and DNA gennencing were performed in the OD
                                                                                                                                                                                                                                                 CGAGGCGGCGCCGTCCTCCT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /clone="WHE3563_B09_C17"

Altenbach and K. Cronin at USDA-ARS, Albany, CA. A cDNA library was made using poly (A) RNA, and the cDNA clones were in vivo excised to give pBluescript SK(-) phagemids in the TJ Close lab (Chin, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (others)."

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous
                                                                                                                                                                                                                                                                                                                                                                                                                   Unidentified

```

; ,

New recombinant construct having a promoter operably sequence which when expressed produces an RNA having mRNA and its reverse complement unrelated to endogenous

A having hom endogenous

linked to a DNA homology to a target ous DNA, for reducing

The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the sequences and their reverse genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 2% ELVISLIVES complementary repeat region DN found in plasmid pKS133 used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAD32908 standard; DNA; 154

                                                                                                 The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in the larges or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce is IX ELVISLIVES complementary repeat region DNA found in plasmid pXS133 cc suppression of Fad2 in soybean

                                                                                                                                                                                                                                                                                                                                                                            CC The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular clipids, including oil, in tissues when the enzyme is absent or rate-cc limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmid pKS133 compression of Fad2 in soybean

Decreasing ratio of liquiritigenin-derived isoflavones isoflavones in a plant comprises transforming plant cel acid sequence showing homology to sequence encoding cha (deoxychalcone synthase). nes relative to total cell with nucleic chalcone reductase elative to total with nucleic

Example 7; SEQ ID NO 7; 25pp; English

The invention relates to decreasing the ratio of liquiritigenin-derived construct comprising transforming a plant cell with a recombinant construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct parts of the plant, an isoflavonoid-producing plant made by the method above, seeds or plant parts of the plant, an isoflavonoid-containing protein product to the total isoflavone levels obtained from the seeds or plant parts, a condict of liquiritigenin-derived isoflavones relative to incorporated the isoflavonoid-containing product, and a method of corporated the isoflavonoid-containing product, and a method of liquiritigenin-derived isoflavones relative to the total isoflavone forms a loop in the stem-loop structure. The nucleic acid sequence forms a loop in the stem-loop structure and the stem comprises a sequence of ADQ07969. The promoter is a seed-specific producing an isoflavone relative to the total isoflavones in an isoflavone-containing product which has seed-specific producing plant. The methods and recombinant construct are useful in creal food product, snack food product, baked good product, fried food product, snack food product, baked good product. The present construct is interested in fired and the single ment, dairy product, pet food product, or animal feed. The present construct is the single stranded version of the stem loop region from the present sequence is the single stranded version of the stem loop region from the present sequence. plasmid pKS151.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
The invention relates to decreasing the ratio of liquiritigenin-derived construct comprising transforming a plant cell with a recombinant construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct to a plant parts of the plant, an isoflavone reductase cDNA). Also included acre an isoflavonoid-producing plant made by the method above, seeds or plant parts of the plant, an isoflavonoid-containing protein product to the total isoflavone levels obtained from the seeds or plant parts, a concorporated the isoflavonoid-containing product, and a method of producing an isoflavonoid-containing product, and a method of converse a loop in the stem-loop structure. The nucleic acid sequence forms a loop in the stem-loop structure. The stem comprises a sequence of ADQ07968). The promoter is a seed-specific producing plant. The method is useful for decreasing the ratio of liquiritigenin derived isoflavones relative to the total isoflavone-specific producing plant. The methods and recombinant construct are useful in producing an isoflavonoid-containing product which is incorporated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transgenic; li

The invention relates to a plant comprising at least one recombinant DNA molecule comprising a promoter operably linked to at least a portion of at least one oxidosqualene cyclase gene, the molecule sufficient to suppress the production of a triterpene or any of its progeny, where the progeny comprise the molecule. The oxidosqualene cyclase gene catalyzes the cyclization of 2,3-oxidosqualene to form a triterpene, e.g. beta-amyrin, lanosterol, lupeol, cycloartenol, alpha-amyrin, isomultiflorenol or any combination. The plants are useful in generating products which may be used as feeds, foods, beverages and industrial products like agricultural adjuvants, concrete supplies, dielectric fluids, dust suppressants, fuel additives, hydraulic fluids, industrial cleaners, industrial lubricants, metalworking fluids, odor reduction, paint
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oxidosqualene cyclase; triterpene; plant protectant; plant; soybean; beta-amyrin synthase; ds.

         The invention relates to a plant comprising at least one recombinant DNA molecule comprising a promoter operably linked to at least a portion of at least one oxidosqualene cyclase gene, the molecule sufficient to suppress the production of a triterpene or any of its progeny, where the progeny comprise the molecule. The oxidosqualene cyclase gene catalyzes the cyclization of 2,3-oxidosqualene to form a triterpene, e.g. beta-amyrin, lanosterol, lupeol, cycloartenol, alpha-amyrin, isomultiflorenol or any combination. The plants are useful in generating products which may be used as feeds, foods, beverages and industrial products like agricultural adjuvants, concrete supplies, dielectric fluids, dust suppressants, fuel additives, hydraulic fluids, industrial cleaners, industrial lubricants, metalworking fluids, odor reduction, paint

                                       The invention relates to a method for increasing isoflavonoid production in a plant, by transforming the plant with a recombinant DNA construct having a polynucleotide (PN) e.g., a PN encoding all or part of flavanone 3-hydroxylase, and second recombinant DNA construct having a PN encoding C1 myb and a R myc-type transcription factor, growing the transformed plant, and evaluating the quantity of isoflavonoid from the plant. The method of the invention is useful for increasing isoflavonoid production in an isoflavonoid-producing plant. The current sequence represents the seed-specific expression vector pKS151, into which a polynucleotide encoding a portion of soybean flavanone 3-hydroxylase was inserted in an example from the invention, for the transformation of Glycine max.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    may play a defense role sequence represents the vector pKS151.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seed-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADF67892
